### DETAILED ACTION

Claims 1-14 are pending.

#### *Claim Rejections - 35 USC § 102*

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 1-14 are rejected under 35 U.S.C. 102(b) as being anticipated by US# 5,795,688 to Burdorf et al.

Burdorf teaches a process for performing automatic inspection of advanced design photomasks. In a preferred embodiment, an aerial image of a portion of a photomask is generated. A simulated image corresponding to original pattern data is also generated. The aerial image and simulated image are then compared and discrepancies are detected as possible defects. A mask design is generated from a binary mask layout. The mask design is then used to generate a photomask such as by suitably etching a chrome layer on a quartz plate. The present invention provides a process for detecting any defects that are formed in the photomask. In a preferred embodiment, an aerial image of the photomask is generated. This is then compared with a simulated image of the binary mask layout which has been adjusted to account for expected distortions and corner rounding caused by image processing of the mask and wafer. Any discrepancies between the aerial image and the simulated image are likely due to defects in the photomask. In a second preferred embodiment, the aerial image of the photomask

is compared with a simulated aerial image of the mask design. Again, any discrepancies between these two images are likely due to defects in the photomask.
